The History of Crystal Singing Bowls

There are different types of singing bowls and I'm sure you've seen most of them – frosted quartz crystal, clear crystal and Tibetan metal singing bowls. In this part of the certification program, we will focus on the frosted quartz crystal singing bowls, however the application and use of the other singing bowls are generally the same.

As you already know, Singing bowls began their journey in ancient times. It is believed that singing bowls were an integral part of Buddhism. Now, sound therapy has traveled across many religions and cultures throughout history.

Sound has always played an important role in supporting the body, mind and spirit in well-being. Our ancestors knew that sound and vibration could be used to balance and heal the energy centers in our body and support us in optimal health. They didn't need fancy equipment and science to prove it, the proof for them was in how they felt after sound therapy.

Crystal singing bowls combine the energy of quartz and sound.

The discovery of using quartz instead of metal was by accident and came from the technology and computer industry. They were using crystal vessels to create quartz for silicon for computer microchips (and they still use this process today). Then it was discovered that the discarded silicon crucibles could create beautiful sounds and frequencies. The sound was extremely resonant.

The singing bowls that were made based on this design have a frosted white, sandpaper texture on the outside and a smooth texture on the inside. These bowls also tend to be thick, heavy and fairly sturdy, though of course, can be broken. The construction helps to give tones which are particularly loud in volume and compared to other bowls – the metal the clear quartz, frosted quartz singing bowls are louder and sing longer. This makes them a favorite for public events, such as festivals and large group sound baths.

Classic Frosted Bowls range in size from 6 to 28 inches and while the smaller ones can be held in one hand, the larger ones can be quite heavy. Generally, the bowls are played on a flat surface like the floor because of this.

Our bodies have a similarity to quartz. On a molecular level, our cells contain silica, which balances our electromagnetic energies. Crystal generates and magnifies the transmission of tones. When the sound changes the brainwaves, you go into a meditative state, even an altered state of consciousness. This can cause the brain to release different hormones and neuro-chemicals too.

Every cell in your body has a geometric crystalline structure. This is why our body resonates so deeply with the frequencies of quartz crystals. Different notes from the bowls have the ability to open, heal, balance and align your chakras. It is also believed that quartz crystals have the ability to balance your electromagnetic field during singing bowl meditation.

There is a vibrational property to quartz which is known as piezoelectricity. And because it can also withstand high temperatures and conduct energy, quartz is used in timekeeping, broadcasting, computer engineering and of course sound healing. The piezoelectricity of quartz means it can vibrate at a precise frequency. With force or pressure applied to it, quartz can convert mechanical energy into electricity.

It is these precise vibrations that is how timekeeping and broadcasting devices work and how they were invented. Like quartz, our bodies possess piezoelectricity, which means our bodies can discharge electric pulses too. When singing bowls are played, the vibrations hit our bodies and create resonance. When the two energy frequencies encounter each other, the two vibrations enter a state of harmonic vibration. This discovery is what led healers to try the singing bowl for alternative medicine and to discover how well they heal.

The vibration of a quartz crystal singing bowl looks like a sine wave. The quartz crystal singing bowl is the only musical instrument that can produce a sine wave. This makes them very unique as a healing tool. This frequency and vibration produces a multi directional sound which can surround us and vibrate within us. This happens because of the structure of quartz crystals and the circular shape of the bowl. This is also why singing bowl sounds can penetrate every dimension of our body and soul, flowing through our bodies like a wave, giving us a relaxation like we have gotten a great massage, PLUS allow our mind to relax like we've had a great session of meditation.

If you use colored bowls, or use candles with colors inside your bowls and match those colors to the chakras they represent, the listener can imagine and breathe in the light to their aura. Some healers believe that this process expands your awareness and brings a positive shift in your consciousness, helping align yourself with your true, original self.

Some energy healers also claim that crystal singing bowls are more effective than metal bowls due to the fact that metal is foreign to the human body. It is believed that quartz crystal singing bowls are aligned to match the frequency found in the human body and that this makes them highly effective as a tool for healing. It is also for this reason why many believe that crystal singing bowls are the best singing bowls.

Because of the nature of quartz and its purity when used to make the bowls, they can withstand the extremely high temperatures needed to melt the raw polycrystalline silicon, (also called polysilicon or poly-Si, which is a high purity, polycrystalline form of silicon). The crystal singing bowls are therefore sometimes called crucibles or melting pots. In a mold, the singing bowls are spun into shape. During the manufacturing process, crystal bowls can be “programmed” to create specific sounds.

Precious stones like emerald, morganite and sapphire are also added sometimes when creating the bowls, but only in small quantities in comparison to the quartz in the bowl.

The color inside the bowls are generally paint. If symbols are inside the bowls, they are usually stickers.

We’ve already covered many benefits of sound therapy and singing bowls in level 1 of the sound healer fundamentals certification. Silica is a building block of collagen in our bodies. This is why singing bowls are helpful for lowering inflammation. The sounds can stimulate circulation and the immune system too. Many people enjoy sound baths for relaxation, releasing stagnant energy (chakras and chi, or life force), and sleep.
