THE FUTURE OF SOUND HEALING

Sound is healing. It's a fact. And, it's not new.

Sound healing has been used for centuries to treat disease and emotional ailments across many cultures.

The scientific community is beginning to explore more and more the potential of sound healing with exciting results.

The future of sound healing therapy will be in the next generation of researchers, scientists, and therapists. The quest to find solutions to the mental and emotional challenges that many people face today is a noble one. And the use of therapeutic sound has been gaining momentum as an effective tool for helping people to overcome their problems.

Sound therapy is not just an alternative treatment; it is a valid means of addressing a wide range of conditions. Many people have found that it helps them overcome stress, anxiety, depression, pain, and even addictions. It is also useful for those who are dealing with chronic illness or disease.

The human ear has evolved over the past million years to pick up the frequencies of sound waves generated by human speech. So it should come as no surprise that our ears aren't fine-tuned for picking up ultrasonic frequencies.

But our skin is – at least, according to new research. In a study published in the journal *Nature Communications*, scientists have shown that we can hear sounds well above our normal hearing range – provided they're touching our skin.

"This is an interesting finding because it's opening up a whole new field of research into human senses," says neuroscientist and lead researcher David Eagleman from Stanford University. "We don't know what other abilities are hiding under the threshold of conscious awareness."

The team started by building a device called a vibrotactile stimulator, which uses electronics to vibrate at different frequencies – think of it as a computerized tuning fork. They then positioned this on a subject's forearm while they were

wearing noise-cancelling headphones, so they couldn't hear anything other than the device.

It's called a vibrotactile stimulator and is basically an armband made up of 40 vibrating motors, which Eagleman calls "a sort of Braille for the skin."

This armband translates sounds into frequency vibrations, allowing people to "hear" with their skin instead of their ears. The user puts on the armband and it sits above the elbow. The wearer doesn't hear anything because there are no vibrations in the air. Instead, each motor vibrates at different speeds and frequencies, depending on what sound waves they're translating.

When we think about vibrational medicine, we often think about that which is ancient. The use of sound and vibration for healing purposes dates back thousands of years, from the chanting of monks to the playing of drums by indigenous healers. While these practices are still used today, there has been a resurgence in the popularity of sound healing due to its non-invasive nature and ability to help people achieve a natural state of balance.

The future is wide open for those who want to work with the power of sound healing. There are numerous ways you can integrate sound into your life, whether you're a seasoned healer or just beginning your journey into wellness.

Sound healing is a rapidly growing field and I believe that this will continue into the foreseeable future. There are many reasons why people seek a sound healing session. The many benefits of sound healing are in part what makes it so appealing to so many people. The increasing interest in holistic health, yoga and meditation also contribute to the growing demand for sound healing sessions.

I believe that we are still learning so much about this type of healing modality and its potential for optimizing human health and wellbeing on all levels. Sound is a powerful tool for shifting consciousness, and it does that by changing our biochemistry as well as our brain activity.

As a Sound Healer, I know and see the positive changes in peoples' lives on a daily basis.

I am empowered by this knowledge and encourage others to join me in this sacred and fulfilling work as well.
