Water and Cymatics

LIFECHANGING
— ENERGY —

WATER AND SOUND HEALING

Water is the stuff of life. Water is 70% of our bodies. Our brains are 95% water. Our blood is 82% water. Our lungs are 90% water. Our muscles and kidneys are 79% water. Even our bones are watery: 31%.

It's no coincidence that we can drink too much water and die or that we can go three weeks without food but only three days without water.

The way water reacts to sound is the reason that sound therapy works in human bodies, and this has been shown in research studies, as well as by thousands of years of practice in cultures all over the world.

Sound travels five times faster in water than it does in air. This means that when sound waves reach our bodies, they don't travel through us, they travel with us because our bodies are mostly made of water (and because we're mostly made of water).

Water is 70% of our bodies and on average 66% of Earth's surface is covered by water. The way water reacts to sound is why sound therapy works in human bodies and planet Earth.

Water is the medium of sound and life on earth. It is the most abundant substance on our planet, making up 70% of our bodies and covering more than 70% of the Earth's surface.

Sound travels 5 times faster in water than it does in air, and sound vibrations can travel through water over long distances without losing very much energy. This is the reason why whales, who communicate with each other through sound, can communicate over hundreds and thousands of miles. We too are mostly water.

For many centuries, people have recognized that all living things exist within an environment of rarefied energy fields or vibrations. The ancient Hindus called this energy field Prana or Chi. The Chinese call it Qi or Ki, while our modern scientists call it biophotons (light particles) or bioenergetics (electro-magnetic frequencies).

The human body is constantly absorbing, emitting and radiating these frequencies through its cells and organs into our surrounding atmosphere. What we do with our bodies affects how we feel: what we eat, how we speak to ourselves and others, how we move... These are all factors that influence our energy levels as well as the energetic state of those around us.

DR. EMOTO

Dr. Emoto was a Japanese scientist who was convinced that the molecular structure of water could be changed by the thoughts, words, and music it was exposed to (Emoto's Water Crystals). So he set out to prove it. He showed how frozen water crystals were beautiful when exposed to happy thoughts and words but ugly when exposed to negative ones.

Dr. Masaru Emoto is a Japanese author and entrepreneur, who in October 2014 came out with a discovery that changed the way we look at water forever. He has done several experiments using high-speed photography to prove that water is deeply connected to human consciousness.

Dr. Emoto conducted his experiments by exposing different types of water to various words, pictures, or music, and then freezing them to see how the resulting crystals differ from each other. Water exposed to positive words like love and gratitude produced beautiful crystals while

those exposed to negative words like you fool and I will kill you turned out malformed.

In one of the early experiments, Dr. Emoto and his colleagues left three identical glasses filled with water in different environments: one on a windowsill in the sun, one under a tree where it was shaded from the light, and one in their laboratory. Every day for 30 days they spoke to the water in each glass. To the first they said things like "you're beautiful," "I love you," and "thank you." To the second they offered insults such as "you are ugly," "you are disgusting," and "I hate you." The third was ignored completely. At the end of the month, all three glasses were frozen and then examined under a microscope. The first two contained beautifully structured water crystals while the third contained ice crystals that were fragmented, distorted and incomplete.

Before explaining Dr. Emoto's experiment, I would like to explain what water is. Water is made up of three atoms; two hydrogen atoms and one oxygen atom. These atoms are held together by the electromagnetic force produced by the nucleus of the hydrogen atoms and a positive charge at the nucleus of the oxygen atom. Water is a liquid because it contains an enormous amount of energy that keeps these atoms bound together in such a way that they can move about freely.

He rose to fame following the publication of his book, 'The Hidden Messages in Water'.

Dr. Masaru Emoto was a Japanese author and pseudoscientist who claimed that human consciousness has an effect on the physical world and that water exposed to positive or negative thoughts shows structural changes when frozen and viewed under a microscope.

He was convinced that if he changed the molecular structure of water then he could change the structure of anything composed mostly of water, including us. From this understanding, he designed an experiment in which he attached written words to bottles containing water and froze them, photographing the resulting crystals.

He then repeated the experiment with thousands of participants around the world and photographed those experiments as well. His research showed that when people looked at water that had been exposed to loving, benevolent, and compassionate thoughts, its crystals were beautifully formed, whereas the crystals of water exposed to negative thoughts turned out poorly formed and malformed.

He also took some samples from natural sources like mountain streams. Those waters crystallized beautifully as well.

Then he took samples from polluted rivers, industrial waste sites and other areas with high pollution levels. Those waters didn't crystallize at all or crystallized very poorly and deformedly.

Cymatics

For centuries, it was believed that reality consisted of two fundamental entities: matter and energy. However, in recent years science has discovered that everything in reality is actually made up of nothing but vibrating energy.

In the late 1800s, Albert Einstein famously stated that everything in life is vibration...

Nothing rests, everything moves, everything vibrates.

Harmonic tones have been used in music since ancient times, and their qualities have been widely appreciated for their effects on human physiology. In the 5th century B.C., Pythagoras used them to heal mental illness, emotional problems, and even to influence the weather. Other cultures have long recognized the healing effects of sound, but it was not until recently that modern science began to explore these phenomena more closely. The science of Cymatics has confirmed much of what the ancients knew about the effect of sound on matter, showing that when sound moves through a substance like water or sand, it leaves behind patterns created by vibration.

In 1680, it was proposed that sound was a form of vibration by Robert Hooke. It wasn't until another 100 years later that Ernst Chladni proved Hooke's theory correct with his book 'Discoveries in the Theory of Sound'. This book showed how sand would vibrate when placed on a metal plate and then sound waves were played on the plate.

In 1963, Swiss researcher Hans Jenny furthered this research and began to explore Cymatics as we know it today.

Cymatics is the study of wave phenomena, and Cymatherapy is a form of sound therapy using tuned instruments to apply harmonic frequencies directly to the body. Through this process we can see the effects of vibration on a physical level.

Cymatics helps us visualize sound. Basically, it's a chance to see what sound waves look like in physical form when they're expressed through matter.

Patterns emerge in sand, powders and liquids when exposed to different frequencies of sound. These patterns are geometric and highly structured and may be due to the physics of the medium or due to an

underlying structure of matter itself. Many believe that these patterns are evidence of a sacred geometry that permeates the universe.

Cymatics can be defined as "the study of wave phenomena." In other words, it's the study of what happens when sound waves move through a particular medium. The word "Cymatics" comes from the Greek word "kyma," which means "wave." It was coined by Dr. Hans Jenny in 1967, based on his experiments with cymatics.

Hans Jenny (1904-1972) founded this field and he spent years experimenting with different materials to discover what their natural vibration would create when exposed to different frequencies. Jenny was able to capture these vibrations on film by using a tonoscope attached to his camera lens, which allowed him to create slow-motion shots that captured the changing shapes made by sound vibrations.

For example, when sound waves move through a particular medium such as water, air or sand, they cause the medium to take on specific geometric forms.

Jenny published his findings in two books, *Kymatik* (1967) and *Kymatik Band 2* (1972). He discovered that each frequency creates a unique shape when played through matter, such as sand or water, which then moves freely until the frequency changes again.

Jenny conducted several experiments that revealed the effects of sound on various types of matter, including water, sand, plasma and even living tissues.

He exposed these materials to different sound frequencies and monitored their response to the vibrations. The results were fascinating geometric patterns that moved in rhythm with the frequency of the sounds.

Because geometric patterns are found everywhere in nature, they are also found throughout our bodies. The chakras and the meridians in our body are based upon sacred geometry and energy vortexes that can be created using cymatics principles. The Egyptians used similar knowledge to build the Pyramids and harnessed their energy to heal people.

The same principles apply to our thoughts and feelings as well as sound frequencies. As we begin to learn more about how our emotions affect our health, it is important to develop stress management techniques like meditation or sound therapy that help us align with a positive state of being.

Jenny's work led to an understanding that sound is more than just something we hear; it is a form of energy that manifests itself in different patterns. The patterns produced by cymatics can be used as an analytical tool to uncover underlying structures in nature and consciousness.
