The History of Tuning Forks

Tuning forks are yet another part of sound therapy, frequency therapy and vibrational therapy. They are considered a type of resonator, which is an instrument that produces a sound without the use of strings or membranes.

Tuning forks were invented hundreds of years ago as just a small instrument made of 2 flat prongs, generally steel. These vibrated and produced a musical note or frequency that was of a constant pitch. The fork was used to tune musical instruments until it was discovered that it had healing powers too.

The history of the tuning fork can be seen even back in the 14th century because Leonardo Da Vinci painted a picture of one. But it was not until 1711 that the English musician John Shore added a handle and made the tuning fork look like the ones we are familiar with today, so he is generally given credit for inventing the tuning fork. Shore was the trumpeter for King George I and was dissatisfied with the pitch piped used to tune his trumpet so he wanted to invent something better. He called his invention a “pitch fork.”

It was only in the 20th century that tuning forks were applied to muscles and bones to create a vibration which was seen as a way to test neural pathways in the body.

One of the most influential figures in sound therapy, Sir Peter Guy Manners, along with a group of scientists and medical doctors began researching biosignatures of the human body. He concentrated his work on the use of sound frequencies that were being used in the treatment of various diseases. They identified 700 commutations so they could identify the precise combinations of frequencies for healthy tissue and organs in the body systems. The commutations used 5 audible harmonic sound frequencies that encouraged the body to normalize imbalances and get the cells to go back to their natural state of vibrational resonance. This was the same time that Hans Jenny was conducting cymatic sound wave experiments that we talked about in the fundamentals certification course.

Manners concluded that sound therapy stimulated the human body’s ability to heal itself.

So, how do tuning forks work?

When the fork is struck and held by its base or stem over certain areas of the body or chakras, it offers healing frequencies. Tuning forks create what's called a "pure sound" with a specific amount of vibrations per second.

Many healers will hover around the ears because you can target brainwave frequencies through the vestibulocochlear nerve in the ear. This nerve connects to the vagus nerve, which is the major parasympathetic nerve in the body. It regulates your digestion and your rest. It will help lower blood pressure, promote relaxation, regulate your blood glucose levels, and the body's release of hormones.

The tuning fork creates vibrations that interact with the air surrounding it. It's hard to see, but as the forks prongs move outward and inward, they push air molecules together, creating small compressions. This movement also pulls the air molecules and form low-pressure areas called rarefactions. The compressions and rarefactions create sound.

The History of Tuning Forks

Some of the first tuning forks were designed for music tuning. It was designed to play an A note, which is also known as Concert A or A 440hz which means it has a frequency of 440 hertz (Hz). This standard is still used today by musicians worldwide.

In the 18th century tuning forks were used for scientific experiments about sound waves. Scientists discovered that the tuning forks could measure gravitational acceleration when they dropped them on soft surfaces like rubber.

Now we use tuning fork vibrations to help people tune in to their own natural rhythms and inner wisdom, through energy work. They're also used for balancing, aligning, clearing and healing chakras and for targeting specific points in the body or areas of pain. Many report feeling more centered or grounded after tuning fork therapy.

When using tuning forks, sound healers select the fork or frequency needed and place them directly on or near the person's body. Note: only weights forks can be used directly on the body. No matter what part of the body needs attention, holding the tuning fork close to the ear, but not too close, helps to alleviate issues.

Of course, like other sound healing tools, tuning forks can relieve stress, help with sleep and meditation, reduce anxiety and even treat depression. Some studies have been done for PTSD as well. Many believe there are many positive effects from tuning fork therapy.

Tuning forks are also used for pain relief, especially if the pain is related to specific chakras or meridian points. They're also great for treating conditions involving the musculoskeletal system and the nervous system — including back pain, muscle pain, and migraines.

Each individual vibration has a different effect on the body, which is why practitioners use a variety of instruments and frequencies to help their clients. With the portability and the sturdiness of tuning forks, they're one of the most popular healing instruments for sound healers.

They are also popular because they sustain their vibrations for long periods of time which is helpful in stimulating the body's energy flow. Tuning forks also create what we call a pure tone. That means that it's a waveform of a single frequency, a tone without harmonics. It's the building block of all sound. Pure tones are rarely found in nature, so our bodies tend to take more notice of them.

The reason why tuning forks work is found in the principle of entrainment. Entrainment is the process of synchronization between two oscillating bodies, which we went into depth in Sound Healer Level 1 Fundamentals.

As a quick recap, when 2 oscillating bodies come together, they synchronize with each other based on this idea of entrainment. As an example, if you use a tuning fork and a bell side by side and you strike the tuning fork and it starts to oscillate, the bell will begin to vibrate at the same frequency as the tuning fork. This is also

what happens inside our body. Since we are made up of energy and energy vibrates at different frequencies, the tuning forks can help us get back into optimal alignment. When illness happens, it creates disharmony and the energy fields inside us are disrupted.

Because our cells emit a frequency when they're healthy, the vibrations from the tuning fork can stimulate the body's natural ability to heal itself. The diseased cell's "bad frequency" is changed to become in sync with healthy frequencies. Thus, the cells are restored back to their original frequency allowing them to heal. The tuning forks and other sound therapy healing instruments use this concept to help to put us back into the right frequencies.

Tuning forks can be used by themselves, but many times, they're used in conjunction with:

- Guided meditation and visualization
- Breathing techniques
- Other Sound therapy instruments (of crystal singing bowls, drums, gongs, rain sticks, etc.)
- Use of crystals and gemstones
- Reiki energy work
- Light touch bodywork

When we use tuning forks, we work with the body's meridian system, similarly to acupuncture. The frequency breaks up blockages in our energy field, allowing the body to heal and function more effectively.

In terms of emotions, layers of tension can build up when we experience stress and trauma. These vibrations become so dense that they manifest physically in our bodies as pain and illness. Repressed emotions also contribute. Using tuning forks and other vibrational therapies can release this stuck energy.

It has been proven multiple times over that certain sounds can have a deep effects, physiologically. They notice that

Sounds have been used experimentally to cause lesions on the brain;

Sounds have been used experimentally to change heart rate;

Sounds have been used experimentally to stimulate endocrine functions;

Sounds have been used experimentally as pain-killers;

Sounds have been used experimentally to induce anaesthesia;

Sounds have been used experimentally to heal tissue

Tuning forks are becoming so popular as an alternative treatment that they are even being used in tuning fork facials. Various areas can be targeted like the chin and jowls. Using tuning forks for facials is believed to rejuvenate the skin, mind, and spirit. It relaxes muscles in the face and helps lymphatic drainage.

People who carry tension in their facial muscles may enjoy this type of facial because it's like a relaxing massage.
